FOREWORD

TL-NA 2018 is the third follow-up compilation after the second benchmark compilation since the independence of Timor-Leste, and it considers 2015 as the base year (2015=100) for the measure at constant prices. The first one was TL-NA 2010 that established 2010 as the base year. Benchmark compilation has the purpose of getting the best level of the GDP and other associated macro magnitudes. Follow-up compilation, like TL-NA 2018 measures the best change in the GDP from 2015, and all the other macro aggregates related to it.

TL’s NA 2000-2018 has been produced by the staff of the GDS of the Ministry of Finance under the supervision of the Director-General of Statistics, Elias Dos Santos Ferreira, with the support of the National Accounts Advisor.

The macroeconomic accounts in TL-NA 2000-2018 are based on the economic data collected through censuses and surveys, including the report on the Business Activity Survey, Government’s Incomes and Expenditures, External Trade Statistics, the Consumer Price Index and other statistics.

Timor-Leste’s National Accounts 2000-2018 are compiled following the United Nations System of National Accounts 2008 (2008 SNA). This publication includes an integrated set of accounts; including estimates of Gross Domestic Product (GDP) compiled using three compilation approaches - production, expenditure, and income.

It further extends the GDP estimates to Gross National Income (GNI), Gross National Disposable Income (GNDI) and Gross Saving, and all compiled under the concepts and definitions of the 2008 SNA.

I want to express my appreciation to the General Directorate of Statistics, Ministry of Finance for the successful implementation of the project, and to the many individuals who contributed to this work.

Sara Lobo Brites

Acting Minister of Finance
December 2019

PREFACE

The publication of Timor-Leste’s National Accounts for 2000-2018 (TL-NA 2000-2018) represents a significant further step by the General Directorate of Statistics (GDS) under the Ministry of Finance in the production, analysis, and dissemination of key economic statistics of Timor-Leste.

The publication comprises this printed publication that contains all the statistics and a summary of the data, and an online version accessible at www.statistics.gov.tl. The Statistics website also includes extra information about the concepts, classifications, sources and methods that underpin the compilation of Timor-Leste’s national accounts.

This publication contains estimates of Gross Domestic Product (GDP), Gross National Income (GNI), Gross National Disposable Income (GNDI), and Gross Saving to give a complete picture of the relationship between product, income and saving aggregates for Timor-Leste. The TL-NA includes a stylized version of the quarterly GDP indicator (qGDPi), expenditure approach, from 2010 onwards.

All the estimates have been calculated by the most current international standards and classifications for compiling macroeconomic accounts. These are the System of National Accounts 2008 (SNA 2008) and the sixth edition of the Balance of Payments and International Investment Position Manual (BPM6), International Monetary Fund (IMF).

The headline GDP for TL-NA 2000-2018 is the GDP expenditure. Even though the production approach has primary sources as good as the expenditure approach in nominal terms, the expenditure approach has been chosen over the production approach because it makes use of higher quality price data sets to get results in constant terms.

Regarding the revision policy of the Timor-Leste National Accounts, TL-NA 2000-2018 includes updated primary sources and improvements in methods. Some numbers could be different if we compare them with TL-NA 2010 – 2017. The main changes in the underlying sources are updated international prices following the World Economic Outlook from IMF and updated compilations for agriculture production from FAO. It improved some methods, for example, the estimation of the exports of coffee (2000 onwards) and the compilation of subsidies at constant prices (2015 onwards). The oil is considered processed by no-resident enterprises (2000 onwards). The Oil-GDP does not exist until the new Timor-Leste-Australia Maritime Boundary Treaty (August 2019) onwards, and it is offset by Royalties. With no changes over ‘Non-Oil’ GDP, GDP henceforth, and GNI (See the Technical Appendix).

---

The 2008 SNA was prepared under the auspices of the Inter-Secretariat Working Group on National Accounts (ISWGNA), which consists of five organizations: The Statistical Office of the European Communities (Eurostat), the International Monetary Fund (IMF), the Organization for Economic Cooperation and Development (OECD), the United Nations Statistics Division and regional commissions of the United Nations and the World Bank. The 2008 SNA was published jointly by the five organizations.
Acknowledgments

The TL-NA 2000-2018 was produced under my direction within the General Directorate of Statistics, Ministry of Finance.

The national accounts follow-up compilation 2018 was implemented by a team comprising the National Accounts Adviser, Ramon Gerardo Aceituno Puga, and staff of the National Directorate of Economic and Social Statistics within the GDS-MoF, Rodolfo Soares (Head), Alzira Doutel, Sónia Smith Fernandes, Armando Gaspar, Marciana Urbano da Cruz, Laura de Jesus Moreira and Avelino Maria de Jesus Marçal.

The National Directorate of Economic and Social Statistics (National Director Cristino Gusmão) contributed to the project. The National Directorate of Systems and Reports (Director Silvino Lopes and João Gusmão) assisted with the manuscript design.

The statistics is a comprehensive and valuable data source for policymaking, analysis, and research. The TL-NA statistics are compiled and published between nine to twelve months after the reference year to which they relate.

CONCLUSIONS

After a big fall in 2017, the GDP continues with a negative growth rate (-0.8%) as shown in Graph 1.

Graph 1: TL 2000-2018 % GDP

1. From the expenditure side, it was determined by the exogenous components of the GDP, public expenditure (7.1%), and the export of goods and services (8.4%). It was for different reasons. The public expenditure goes up driven by the increased in public investment. Exports of goods increased, determined by the exports of coffee (38%), given the rise in the production of coffee (20%).

2. From the production side, industries confirm the same history. The GDP at factor cost or Gross Value Added (GVA) decreased less (-0.3%). It decreases all the industries covered by the Business Activity Survey, more private, formal and pro-cyclical industries restricted by demand, except construction, that increased by 5.8% in constant terms. Also, the other industries not covered by the BAS increased, such as public administration, informal and counter-cyclical industries restricted by supply, such as agriculture, increased by 4.4%. As shown in Graph 2.

Most of the industries declined, such as Retail and wholesale (-5.7%), Accommodations and Restaurants (-15.0%), Real Estate (-3.3%), Financial and Insurance (-8.5%), Transport (-18.8%). On the other side, some industries also increased which is support the recovery of GDP such as Public Administration (+5.9 following the increase in educations and health), Construction (+5.8% by an increase in public investment), Agriculture (+4.4% production of rice, maize and coffee), Information and Communications (+3.8% because many companies expanded their products to municipality).

3. Graph 3 below shows stagnation in nominal Gross Mixed-Income, despite a recovery associated with the household income in the subsistence agriculture (+4.5%). Compensations of employees fall (-2.5%)
driven by the Non-financial and Financial corporations (-4.5%). Gross Operating Surplus decreased (-0.7%), despite the increase of Consumption of Fixed Capital (+7.8%).
SUMMARY

At constant prices (2015=100), in 2018 the GDP decreased 0.8% following the GDP expenditure (e) approach, as the headline GDP (GDP = GDP (e)). The GNI decreased by 1.5%.

- The increase in GDP was based on General Government investment (+19.2%) for an increase in the expenditure of the Infrastructure Fund.

- Exports of goods (+41.3%) led by the exports of coffee driven by an increase in the production of coffee (+20%).

- In quarterly terms, the GDP (e), comparing the same quarters between 2017 and 2018, increased in Q1 (21.5%) and decreased in Q2 (-13.6%). Following that, it expanded to -34.7% in Q3 and recovered in Q4 (26.1%).

- From the supply side, the GDP (production approach), also declined by -0.8%. All the industries down, except for Public administration (+5.9%), construction (+5.8%), agriculture, forestry and fishing (+4.4%), information and communication (+3.8%) and manufacturing (+2.8%).

- The GDP per capita decreased by 4.5% in current terms.

Graph 4: Gross Domestic Product and Gross National Income at Current Prices, 2010 to 2018 (millions of US dollars)

Key Points

- Gross Domestic Product (GDP) at current prices for Timor-Leste in 2018 was $1,568.6 million.

- The Gross National Income (GNI) for Timor-Leste in 2018 was $2,248.6 million. Of this: Property Income contributed with $718.5 million mainly Royalties and Taxes from Oil and Gas activities in JPDA ($ 510.1 million)

- The GDP per capita in current prices was $1,237.1 in 2018.

- The GNI per capita in current prices was $1,773.4 in 2018.

- In constant prices, the GDP decreased by 0.8 percent given that the Development Partners expenditures dropped-off (-13.4%) during 2017 and (-7.4%) in 2018 and also the decrease in private investment (-52.9%). But, on other hand, the General Government investment increased by 19.2 percent and exports of goods increased by 41.3 percent.
Graph 5 illustrates a robust structural relationship in the economy of Timor-Leste:

First, the change in the GDP expenditure follows the changes in public spending (e.g. consumption and investment).

Second, the net Exports (Exports of goods and services, net of Imports of goods and services) follow (with the opposite sign) the public sector expenditure, so there is a positive correlation between public investment and imports. Also, the effect of public investment was offset by imports (leaks), given the low demand for local production.

Third, there is a robust political cycle in public expenditure and development partners’ expenditure. Also, they are correlated with some lag. A good example is 2012 and 2017.

GDP Components in 2018

GDP in constant prices, by the expenditure approach, decreased by -0.8% in 2018, compared with -3.8% in 2017.

Expenditure Approach. Annually

Table II shows the growth rates and the contributions to growth of the expenditures from the public sector, the private sector, development partners and from the external sector.

In the first term, for compositional analysis according to the contributions to growth, in percentage points, they are growth rate in t (2018) over t-1 (2017), weighted by the participation of the item in the aggregated values in t-1 (2017) (see the Glossary). The sum of each component of the contributions to growth in percentage points (+4.8-1.1-3.2+0.2-1.3-0.2) in 2018, is the same of GDP growth rate in the year (-0.8). The same is true, for some specific component. For example, Public
Consumption (0.4) plus Public Investment (4.4) is the Public Contribution (4.8) to the GDP, in 2018.

The overall consumption contributes to GDP in 1.1 percentage points. The increase in public and private consumption (0.4+1.4) percentage point offset the fall in development partners consumption in 0.7 percentage points.

However, the overall investment contributes (-0.6) percentage points to the GDP. Because the increase in public investment, 4.4 percentage points does not compensate the decrease in private plus development partners investment, in (-5.0) percentage points (-0.4-4.6).

So, the Gross National Expenditure (GNE) contributes to GDP in (+0.3) percentage points (1.1-0.6-0.2). If the Exports are added (+0.2) and the Imports are deducted (-1.3), the GDP is estimated in -0.8 growth rate in 2018.

Individual movements in the items of the GDP, growth rates in constant prices, were as follows, by sectors:

PUBLIC SECTOR

Public sector expenditure increased by 7.1% in 2018, of which: public investment rise by 19.2%. It was because of the increase in the capital formation of fixed assets, such as buildings and structures (19.2%). Besides, public sector consumption has also increased by 0.9%, and an increase in the consumption of fixed capital assets drove it such as buildings and structures (5.0%).

DEVELOPMENT PARTNERS

- Development Partners and Technical Assistance expenditure declined by -7.4% in 2018 (after experiencing a fall of -12.6% in 2017). Both in terms of consumption (-5.8%) and investment (-15.2%) declined.

PRIVATE SECTOR

- It expenditure decreased by -4.6%. Consumption increased by 2.2% in real terms. In 2018, the Private investment experience a big fall by -52.9%, through private corporations, which their Fixed Capital Formation declined by 61.3% (from machinery and equipment).

CHANGE IN INVENTORIES

- The Change in Inventories, in 2017, it maintained the same level as in 2016, from the retail and wholesale trade industry. In 2018, it experienced a decline by 11.9 percent (23 USD millions) with the same reasons.

EXPORTS AND IMPORTS

- The Exports of Goods and Services increased by 8.4%. The exports of goods rose 41.3% after experiencing a big decrease of -56.5% in 2017 since coffee exports depend on some seasonal factors, such as weather and farming activity: regrowth and harvesting time (twice a year) and for 2018 there is a good seasonal so the coffee production increased by 20%.

- Imports of Goods and Services increased (2.3%). With goods (-3.2%), the import of machinery and electrical contributed the imports (-32.0%) and mineral products (-12.9%). The import of services increased by 10.6%, associated with the increased in public investment from construction.

---

3 Considering the price of coffee according the IMF/World Economic Outlook Report, given the volatility of local unit value.
**Expenditure Approach. Quarterly**

The quarterly GDP (qGDPi), expenditure approach replicates the annual GDP at quarterly temporal frequency using—as possible—the same concepts, sources, and methods. However, it is an indicator since a yearly national account variable (for example, Private Consumption) is used as a benchmark, and being *temporally disaggregated* using quarterly indicators.

Table III shows the quarterly profile of the qGDPi (e) and its components, in terms of a contribution to the growth rate. If seasonality (SA) is removed through some procedures based on auto-regressions (AR) and Moving Averages (MA) techniques, it is possible to better analyze the movements of the economy in the short term.

| Table III. 2018: Quarterly GDP (e) Indicator. Contributions to Growth (Percentage points) |
|---------------------------------|---|---|---|---|---|
| Private consumption             | 4.1 | 1.7 | 2.2 | -1.3 | **1.4** |
| Private investment              | -5.5 | -4.8 | -4.1 | -4.5 | **-4.6** |
| Development Partners            | -7.6 | -4.8 | 8.1 | -1.2 | **-1.1** |
| Gen. Gov. Consumption           | 3.2 | -9.1 | -9.1 | 15.7 | **0.4** |
| Public investment               | 25.3 | -5.8 | -20.3 | 22.1 | **4.4** |
| Exp. goods & ss.                | -0.2 | 0.4 | 0.3 | 0.0 | **0.2** |
| Imp. goods & ss.                | -2.6 | -9.0 | 11.7 | 4.6 | **1.3** |
| goods                          | -7.4 | -1.4 | 5.4 | -2.3 | **-1.1** |
| Services                       | 4.8 | -7.6 | 6.4 | 7.0 | **2.4** |
| Change in Inventories           | -0.5 | -0.2 | -0.1 | -0.1 | **-0.2** |
| GDP (e)                        | 21.5 | -13.6 | -34.7 | 26.1 | **-0.8** |

With the seasonal adjustment, it is possible to compare quarterly GDP growth rates, unlike in non-seasonally adjusted (NSA) series. Thus, it is possible to examine quarterly changes in the economy’s direction, as shown in Graph 7.

The difference between the original series and the adjusted series is for seasonal factors\(^5\), and the adjusted series reflects the trend-cycle and the random elements. Given that it identifies the seasonal factors inside the year, then the yearly growth rate (-0.8%) does not change. Only the quarterly % q/q growth rates vary.

The quarterly data described the temporal profile of the macroeconomic events. After a big fall in 2017, GDP had a small fall by -0.8%. As per quarterly basis, the most contributed quarter to the annual GDP in Q4, which, it added 26.1%, driven by public investment with 22.1% and the lowest contributed (-4.5%) by private investment.

The second most contributed 21.5% to the annual GDP in Q1, also led by public investment (25.3%) but it stopped in Q2 and Q3.

In Q2 and Q3, all the components contributed less (-13.6%, Q2 and -34.7%, Q3) to the annual GDP. In Q2, the most supported component is imports of goods and services (-9.0%) and public investment supply -20.3% impacted the sharp declined in GDP in Q3 to -34.7%.

---

\(^4\) Given the non-linearity involved, the yearly growth rates are approximately the average of the quarterly growth rates. Better approximation, when the time series are monotonic, as private consumption. Bad approximation when the time series are non-monotonic, as GDP (e).

\(^5\) Following a (1, 0, 1) x (1, 0, 1) [4] Seasonal Arima Model, selected by the lowest AIC.
### Production Approach

The GDP (p) fell by -0.8%, after experiencing a fall of -3.7% in 2017, according to the reviewed values.

Graph 8 shows the value-added growth rates by industry in constant prices (2015=100) for 2018.

**Graph 7: Growth Rates by Industry, Constant Prices, 2018 (per cent)**

- **Agriculture, forestry and fishing (+4.4%).** Supported by an increase in maize (+11.5%), rice (+8.7%), and coffee (20%), after a substantial decrease in 2017 (-42.2%).
- **Construction (+5.8%).** A sharp increase in public construction given an increase in public investment.
- **Transport (-18.8%).** Following the decrease in overall economic activity.
- **Retail and Wholesale (-5.7%).** In line with the decrease in merchandise imports and consistent with the decreased in Development Partners Consumption Expenditure (-5.8%).
- **Accommodations and Restaurants (-15.0%).** By an effect of the decrease in Development Partners Expenditures.
- **Public Administration (+5.9%).** By an increase in employment in health and educations.
- **Information and Communications (+3.8%).** The companies extend their market to municipalities.
- **Real estate decreased (-3.3%) by a decline in business and imputed rents.** It tends to continue the normalization process after a big increase from 2007 – 2014.
- **Other Services (-16.4%).** It declines because of Development Partners supports that have been slowed down during the last two years.
- **Financial and insurance activities (-8.5%).** The volume of operations to finance economic activities by the households decreased. In addition, there is a statistical effect given the big increase in 2017.
- **Manufacturing (+2.8%).** The increase in the processing of coffee and the expansion of the beverages industry contributed to it.

### Statistical Discrepancy

Expenditure (e), Production (p) and Income (i) are different faces of the same economic process. This is true for their values too:

\[
\text{GDP}_e = \text{GDP}_p = \text{GDP}_i
\]

However, only for a country with a good information system, like Australia from 1994-1995 onwards based on the supply-use table, or for a private enterprise with audited financial statements.

This is not the situation for many countries. As we see the following table for TL, there are some differences, statistical discrepancies (see...
the *Glossary*), in the current (') and constant terms between GDPe and GDPp (in TL given the lack of independent sources for incomes, GDPp = GDPi).

Table IV. Statistical Discrepancies (2017-2018)

<table>
<thead>
<tr>

<td>1591.5</td>
</tr>
<tr>
<td><strong>GDPe - GDPp</strong></td>
<td>-13.6</td>
<td>-13.4</td>
</tr>
</tbody>
</table>

The statistical discrepancies happen given the National Accounts uses:

- With different methods (administrative registers, surveys, samples, census, statistical data, et al.).
- With different lags (for example, agriculture two years lag).

- In addition, with different valuation: cash basis for the government expenditures and accrual basis in the others (i.e. trade of goods).

These datasets are compiled for their own purposes and not for national accounts except for the Business Activity Survey. In addition, given the lack of some data, National Accounts makes some estimations, for example, for agriculture, private consumptions and producer price index[^6].

Statistical techniques in the compilation process (classification, normalization, aggregation) and the reconciliation process, with the support of an internal supply-use table, reduce the statistical discrepancy to some acceptable levels. Some countries disseminate an average. Others countries like Australia prior 1994-1995, and Timor-Leste disseminate the statistical discrepancies and two measurements of the GDP, expenditure and production, selecting one of them as the headline GDP, GDPe in TL based in price consideration.

[^6]: All of this, currently under process by the Minister of Agriculture (*Agriculture Census*), and DGS (*Household Consumer Survey and PPI Project*)
TECHNICAL APPENDIX: Changes in Oil Compilation

Until TL-NA 2000–2017, the JPDA was considered as a resident entity. However, all the other datasets in Timor-Leste considered JPDA as non-resident: Customs does not register Oil Exports in Trade Data, the MoF does not include oil in its government financial statistics, and Central Bank includes royalties from oil in the Balances of Payments. This situation creates inconsistencies between different datasets in the Timor-Leste information system.

The GDS-MoF considered JPDA as a non-resident in TL-NA 2000–2018*. The main consequence is that Oil-GDP disappears, Non-Oil GDP becomes GDP, and it includes Royalties in Primary Income, so the GNI does not change. The stylized way of the changes in oil compilation is shown below:

\[
\begin{align*}
\text{Non-Oil GDP} & = \text{GDP} - \text{Oil GDP} - \text{Oil Primary Income} \\
\text{Non-Oil Primary Income} & = \text{Non-Oil Primary Income} \\
\text{TOTAL:} & = \text{TOTAL:} \\
\text{GNI} & = \text{GNI} \\
\end{align*}
\]

Given that Non-Oil GDP becomes GDP, the GNI does not change because Royalties is Oil GDP less Oil Primary Income. In the graph below:

- TL-NA 2000-2017 begins with non-oil GDP (red line), then add oil GDP (black line), and deduct all Primary Income because, Oil Primary Income (debit > credit) is bigger than Non-Oil Primary Income (credit > debit), to arrives at GNI (blue line).
- TL-NA 2000-2018 starts with (non-oil) GDP (red line), and then all Primary Income, (Royalties plus non-Oil Primary Income) is added, to obtain the GNI (blue line).

Given that Non-Oil GDP becomes GDP, the GNI does not change because Royalties is Oil GDP less Oil Primary Income. In the graph below:

- TL-NA 2000-2017 begins with non-oil GDP (red line), then add oil GDP (black line), and deduct all Primary Income because, Oil Primary Income (debit > credit) is bigger than Non-Oil Primary Income (credit > debit), to arrives at GNI (blue line).
- TL-NA 2000-2018 starts with (non-oil) GDP (red line), and then all Primary Income, (Royalties plus non-Oil Primary Income) is added, to obtain the GNI (blue line).

However, given the new Maritime Boundary Treaty signed in August 2019, through which JPDA is considered as a resident entity from September 2019, all the different dataset (trade data, GFS, and BOP) are including oil in their data compilation. And also, the TL-NA 2019 from September 2019 onwards.

GLOSSARY OF TERMS

Actual consumption

To allow because the consumption of goods and services by households may be paid for, in cash or kind by the general government sector, an alternative measure of consumption called actual consumption had been defined. It is measured by first separating government final consumption expenditure (GFCE) into individual and collective consumption. Individual consumption refers to services that are provided by the general government to households that are consumed individually, for example, health and education. Collective consumption relates to the provision of public services such as policing and defense. Household actual consumption is measured as household final consumption expenditure plus individual consumption within GFCE. General government actual consumption is measured as GFCE less individual consumption. Actual consumption is a useful measure for international comparison since countries often have different systems for providing Individual services.

Capital transfers

Transactions in which the ownership of an asset (other than cash and inventories) is transferred from one institutional unit to another, in which cash is transferred to enable the recipient to acquire another asset or in which the funds realized by the disposal of another asset are transferred.

Changes in inventories held by enterprises and general government

It is an estimate of the change in the book value of inventories held by enterprises and the government from the start of the reference year to the end of the year. In other terms, it is the value at the level of establishment and for an accounting period, of the additions fewer withdrawals to the stock of inventories of raw materials and finished products. The additions originate in production and imports and retreats for use as intermediate consumption and final demand.

Collective consumption

Services provided simultaneously to all members of the community or all members of a particular section of the community, such as all households living in a particular region. Collective services are automatically acquired and consumed by all members of the community, or group of households in question, with no action on their part. Typical examples are public administration and the provision of security, either at a national or local level. Collective services are the ‘public goods’ of economic theory. Collective services cannot be sold to individuals on the market, and they are financed by government units out of taxation or other incomes.

Compensation of employees

The total remuneration, in cash or kind, payable by an enterprise to an employee in return for work by the employee during the accounting period. It is further classified into two sub-
components: wages and salaries; and employers’ social contributions. Compensation of employees is not payable regarding unpaid work undertaken voluntarily, including the work by members of a household within an unincorporated enterprise owned by the same household. Compensation of employees excludes any taxes payable by the employer on the wage and salary bill (e.g. payroll tax). See also Employers’ social contributions; Wages and salaries.

**Constant price measures**

The current price values of production-based and expenditure-based gross domestic product estimates and their components can be conceived as the product of the underlying quantities of goods and services and their prices. Deflating the current price values by price indexes removes the effect of changing prices on the values. The resulting estimates are referred to as constant price estimates (or quantities, or volumes). Constant price estimates are calculated by applying the prices applying in a particular year (the base year) to all the years in the series. The Timor-Leste national accounts have adopted 2015 as the base year for its constant price series.

**Consumption of fixed capital**

The reduction in the value of fixed assets used in production during the accounting period resulting from physical deterioration, normal obsolescence or normal accidental damage. Unforeseen obsolescence, major catastrophes and the depletion of natural resources are not taken into account.

**Contributions to Growth in GDP**

A contribution to growth in GDP is the addition of some aggregate to GDP in percentage points. The sum of the percentage points, or contributions to the growth of all the aggregates, gives the rate of growth of the GDP. It is calculated as \( \left( \frac{A_{g \ t} - A_{g \ t-1}}{GDP_{t-1}} \right) \times 100 \). Where: \( A_{g \ t} \) is the value of aggregate in the year under consideration, \( A_{g \ t-1} \) is the value of aggregate \( A \) in the previous year and, \( GDP_{t-1} \) is the value of GDP in the previous year. Also, it can be interpreted as “incidence” of aggregate \( A \), defined as the rate of growth of an aggregate, weighted by the share of the aggregate in the GDP in the previous year: \( \left( \frac{A_{g \ t}}{A_{g \ t-1}} - 1 \right) \times 100 \times \left( \frac{A_{g \ t-1}}{GDP_{t-1}} \right) \).

**Current prices**

Estimates are valued at the prices of the period to which the observation relates. For example, estimates for 2009 are valued using 2009 prices. In contrasts with constant price measures where the prices used in valuation refer to the prices of the base year. See also constant price measures.

**Current transfers**

Transfers, other than those classified as capital transfers, in which one institutional unit provides a good, service or cash to another unit without receiving from the latter anything of economic value.
Economically significant prices

Prices that have a significant influence on both the amounts producers are willing to supply and the amounts purchasers wish to buy.

Employers' social contributions

Payments by employers intended to secure for their employees the entitlement to social benefits should certain events occur, or specific circumstances exist, that may affect their employees' income or welfare - work-related accidents and retirement.

Exports of goods and services

The value of goods exported and amounts receivable from non-residents for the provision of non-factorial services by residents.

Final consumption expenditure - general government

Government final consumption expenditure is current expenditure by general government bodies on services to the community such as defense, education, and public order and safety less any explicit charges for these services. If these are provided free or at charges which cover only a small proportion of costs, the government is considered being the consumer of its output. This output has no observable market value, and so it is valued in the national accounts at its cost of production. It also includes the value of the portion of market output purchased by the General Government sector on behalf of beneficiaries.

Final consumption expenditure – households

Net expenditure on goods and services by persons. This item excludes expenditures by unincorporated businesses and expenditures on assets by non-profit institutions (included in gross fixed capital formation). Also excluded is expenditure on maintenance of dwellings (treated as intermediate expenses of private enterprises), but personal expenditure on motorcycles and other durable goods and the imputed rent of owner-occupied dwellings are included. The value of 'backyard' production (including food produced and consumed on farms) is included in household final consumption expenditure and the payment of wages and salaries in kind (e.g. food and lodging supplied free to employees) is counted in both household income and household final consumption expenditure.

Final consumption expenditure – non-profit institutions serving households

Current expenditure by non-profit institutions on the provision of goods and services to households. This output has no observable market value and so is valued in the national accounts at its cost of production.

Fixed Assets

Are defined as produced assets that are used repeatedly, or continuously, in processes of production for over one year. Fixed assets include not only structures, machinery and equipment and intellectual property products but also cultivated assets such as trees and
animals that are used repeatedly or continuously to produce other products such as fruit and dairy products.

**Gross domestic product, GDP, GDP (E), GDP (P), GDP (I)**

In Timor-Leste, from 2010 onwards, the GDP is measured from the Production Approach (GDP (P)), Expenditure Approach (GDP (E)) and Income Approach (GDP (I)). Only the first two are true independent measures: The GDP (P) is the total market value of goods and services produced in Timor-Leste within a period after deducting the cost of goods and services used up in the process of production but before deducting allowances for the consumption of fixed capital. The GDP (E) is equivalent to gross national expenditure plus exports of goods and non-factorial services less imports of goods and non-factorial services. In TL-NA the *headline* GDP is GDP (E).

**GDP per capita**

**Gross fixed capital formation - general government**

Expenditure on new fixed assets plus net expenditure on second-hand fixed assets whether for additions or replacements. Expenditure on new road works (or upgrading existing roads) is included, but expenditure on road repair and maintenance is classified as government final consumption expenditure.

**Gross fixed capital formation – private**

Expenditure on fixed assets. Expenditure on repair and maintenance of fixed assets is excluded, being chargeable to the production account. Additions to fixed assets are capital formation. Also included is a compensation of employees and other costs paid by private enterprise in connection with own-account capital formation. Expenditure on mineral and petroleum exploration is gross fixed capital formation.

**Gross fixed capital formation - public corporations**

Expenditure on new fixed assets plus net expenditure on second-hand fixed assets and including both additions and replacements. Also included is a compensation of employees and other costs paid by public corporations in connection with capital works undertaken on their account.

**Gross mixed income of unincorporated enterprises**

The surplus or deficit accruing from production by unincorporated enterprises. It includes elements of both compensations of employees (returns on labor inputs) and operating
surplus (returns on capital inputs). Also included are estimates of the imputed income derived from subsistence agriculture and other informal production activities.

**Gross national disposable income (GNDI)**

Is equivalent to gross national income plus all secondary income in cash or kind receivable by resident institutional units from the rest of the world (i.e. remittances), less all secondary income in cash or kind payable by resident institutional units to the rest of the world.

**Gross national expenditure**

The total expenditure within a period by Timor-Leste residents on final goods and services (i.e. excluding goods and services used up during the period in the process of production). It is equivalent to gross domestic product plus imports of goods and services less exports of goods and services.

**Gross national income (GNI)**

The aggregate value of gross primary incomes for all institutional sectors, including net primary income receivable from non-residents.

**Gross national savings**

It is calculated as gross national disposable income less final consumption expenditures of households, general government and non-profit institutions serving households. Gross national savings is the surplus generated in the reference year and available to finance investments, including in fixed capital formation.

**Gross operating surplus**

The operating surplus accruing to all enterprises, except unincorporated enterprises, from their operations in Timor-Leste. It is the excess of gross output over the sum of intermediate consumption, compensation of employees, and taxes less subsidies on production and imports. It is calculated before the deduction of consumption of fixed capital, dividends, interest, royalties and land rent, and direct taxes payable. Gross operating surplus is also estimated for the general government, and it equals the general government's consumption of fixed capital.

**Gross value added**

The value of output, in Timor-Leste National Accounts at producer's prices, minus the value of intermediate consumption at purchaser's prices. The term is used to describe gross product by industry. It includes Compensation of employees, Taxes on products and others on production and imports, less subsidies on products and others on production, Gross Operating Surplus, and Gross Mixed Income.
Implicit price deflator

It is obtained by dividing a current price value by its real counterpart (the constant price measure). When calculated from the primary national accounting aggregates, such as gross domestic product, implicit price deflators relate to a broader range of goods and services in the economy than that represented by any of the individual price indexes such as the consumer price index.

Imports of goods and services

The value of goods imported and amounts payable to non-residents for the provision of non-factorial services to residents.

Individual consumption

An individual consumption good or service is one that is acquired by a household and used to satisfy the needs and wants of members of that household. Individual goods and services can always be bought and sold on the market, although they may also be provided free, or at prices that are not significant, or as transfers in kind. Individual goods and services are 'private', as distinct from 'public'. See also Collective consumption.

Institutional unit

An institutional unit is an economic entity that is capable, in its own right, of owning assets, incurring liabilities, engaging in economic activities and engaging in transactions with other entities.

Intermediate consumption

Comprises the value of the goods and services used as inputs by a process of production, excluding compensation of employees and the consumption of fixed capital.

Inventories

Comprise stocks of outputs that are held at the end of a period by the units that produced them before they're being further processed, sold, delivered to other units or used in other ways and stocks of products acquired from other units used for intermediate consumption or resale without further processing.

Livestock

Livestock assets are classified as either fixed assets or inventories. That livestock used in the production of other products (e.g. breeding stock and dairy cattle) are fixed assets. Inventories cover all other livestock types and include those animals raised for meat or other one-off products (e.g. leather).
Market output

The output that is sold at prices that are economically significant or otherwise disposed of on the market, or intended for sale or disposal on the market.

Net secondary income from non-residents

All transfers to or from non-residents to resident government or private institutional units which are not payments for goods and services, compensation of employees or property income.

Non-market output

Goods and services produced by an institutional unit that are supplied free or at prices that are not economically significant.

Other subsidies on production

Comprise all subsidies, except subsidies on products, which resident enterprises may receive because of engaging in production. Other subsidies on production include subsidies related to the payroll or workforce numbers, including subsidies payable on the total wage or salary bill, on numbers employed, or on the employment of particular types of persons, e.g. persons with disabilities or persons who have been unemployed for a long period. The subsidies may also be intended to cover some or all of the costs of training schemes organized or financed by enterprises. Subsidies aimed at reducing pollution is also included. See also Subsidies on products.

Other taxes on production

It comprises all taxes that enterprises incur because of engaging in production, except taxes on products. Other taxes on production include taxes related to the payroll or workforce excluding compulsory social security contributions paid by employers and any taxes paid by the employees themselves out of their wages or salaries. Recurrent taxes on land, buildings or other structures; some business and professional licenses where no service is provided by the Government in return; taxes on the use of fixed assets or other activities; stamp duties; taxes on pollution; and taxes on international transactions.

Output

It comprises those goods and services that are produced within an establishment that become available for use outside that establishment, plus any products produced for own final use.

Primary incomes

Comprise incomes that accrue to institutional units because of their involvement in processes of production or their ownership of assets that may be needed for production.
Property income

Is the income receivable by the owner of a financial asset or a tangible non-produced asset in return for providing funds, or putting a tangible non-produced asset at the disposal of another institutional unit.

Purchasers' price

The amount paid by the purchaser, excluding any deductible tax, to take delivery of a unit of a good or service at the time and place required by the purchaser. The purchaser's price of a good includes any transport charges paid separately by the purchaser to take delivery at the required time and place.

Secondary income

Comprises receipt and payment of current transfers.

Social assistance benefits in cash to residents

Includes current transfers to persons from general government in return for which no services are rendered or goods supplied. Principal components include scholarships; maternity, sickness and unemployment benefits; family allowances; and widows’, age, invalid and repatriation pensions.

Statistical discrepancy, SD, SD (E) and SD (P)

Statistical discrepancy is the numerical difference obtained for the estimation of the same variable using different approaches, sources and methods. Applied to GDP, there are different approaches, GDP (E) or GDP (P) for example. In TL-NA 2000-2013, given that GDP (E) is the headline GDP, then the Statistical Discrepancy is $SD = SD (E) = GDP(E) - GDP(P)$.

Subsidies on products

Subsidies payable per unit of a good or service. The subsidy may be a specific amount of money per unit of a quantity of a good or service, or it may be calculated ad valorem as a specified percentage of the price per unit. A subsidy may also be calculated as the difference between a specified target price and the market price paid by a purchaser. A subsidy on a product becomes payable when the product is produced, sold or imported, but it may also become payable in other circumstances, such as when a product is exported, leased, transferred, delivered or used for own consumption or own capital formation.

Taxes less subsidies on production and imports

Defined as ‘taxes on products’ plus ‘other taxes on production’ less ‘subsidies on products’ less ‘other subsidies on production’.
Taxes on production and imports

Comprise ‘taxes on products’ and ‘other taxes on production’. These taxes do not include any taxes on the profits or other income received by an enterprise. They are payable irrespective of the profitability of the production process. They may be payable on the land, fixed assets or labor employed in the production process, or on specific activities or transactions.

Taxes on products

Taxes payable per unit of some good or service. The tax may be a specific amount of money per unit of a quantity of a good or service (quantity being measured either in terms of discrete units or continuous physical variables such as volume, weight, strength, distance, time). Or it may be calculated ad valorem as a specified percentage of the price per unit or value of the goods or services transacted. A tax on a product becomes payable when the product is produced, sold or imported, but it may also become payable in other circumstances, such as when a good is exported, leased, transferred, delivered, or used for own consumption or own capital formation.

Terms of trade

Calculated by dividing the export implicit price deflator by the import implicit price deflator and multiplying by 100.

Total factor income

That part of the cost of producing the gross domestic product that comprises gross payments to factors of production (labor and capital). It represents the value added by these factors in the process of production and is equivalent to gross domestic product less taxes plus subsidies on production and imports.

Wages and salaries

Comprise amounts payable in cash including the value of any social contributions, income taxes, fringe benefits tax, etc., payable by the employee even if they are withheld by the employer for administrative convenience or other reasons and paid to social insurance schemes, tax authorities, etc., on behalf of the employee. Wages and salaries may be paid as remuneration in kind instead of, or besides, compensation in cash. Separation, termination and redundancy payments are also included in wages and salaries. Wages and salaries are also measured as far as possible on an accrual rather than a strict cash basis. See also Employers’ social contributions; Compensation of employees.
