Exploration Activities from Murak Rai Timor, E. P

REE PROJECTS

Concessions and type of formation

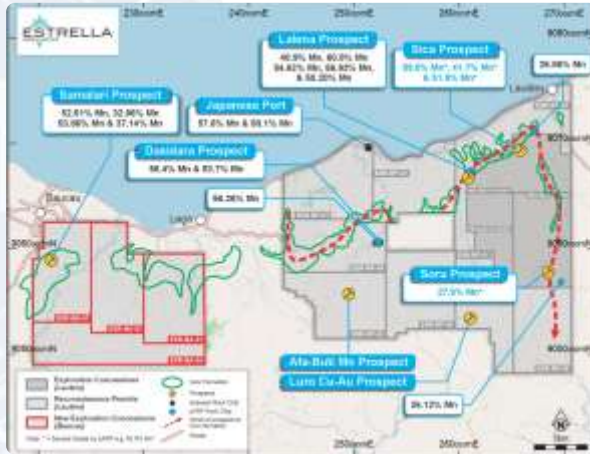

- MRT commenced initial work in August 2024, first company attempts to explore for REE potential in Timor-Leste.
- 3 blocks in the Western part of the island, with total area size of 150km².
- Mostly covered by Bobonaro Complex/Bobonaro Mélange/Bobonaro Scaly Clay.
- A chaotic unit composed mostly of broken, clay-rich layers that are mixed to varying degrees with structurally and stratigraphically overlying units. Containing a wide variety of unsorted blocks in scaly clay matrix, with thick, wide geographic distribution in Timor and around the Banda Arc orogeny.

Exploration Activities from Estrella Resources

By July 2024 – Significant Reconnaissance Success – Landholding Increased to Around 650 square kilometres

Timor-Leste's 1st Modern Exploration Drilling, Estrella Partnership with CoreSearch Mining LDA

The President of the ANM, Rafael M. de Araújo and representatives from Murak Rai Timor were at the rig when the first Manganese drill core was extracted from Estrella Murak Rai and Timor-Leste's maiden drillhole EMDD001 at the Ira Miri Prospect in Lautém. EMDD001 intersected over 7.2m of massive manganese oxide, ending in mineralisation.

The map displays the study area in the Lake Tanganyika region. Key locations marked include Mafurico, Beshima, Mupa Sali, and Muta Kimo. The Kalambo River is shown flowing through the area. The map includes a legend for rivers, roads, and administrative boundaries, and a scale bar from 0 to 10 km.

*Values in Table 1 that are estimates of glaucuronides of micropoly oligomers and monomers.
